There is no substitute for “Excellent Science”:

*The best writing in the world cannot make a poor idea fundable:

→ **HOWEVER** ←

*The best science in the world can easily be destroyed by poor writing and is not fundable if not clearly communicated to the reviewers.

Environmental and Molecular Toxicology

“

There is no grantsmanship that will turn a bad idea into a good one, but there are many ways to disguise a good one.

William Raub, a former deputy director of NIH

”

THE 'F' WORD

*What are the major factors that determine whether a grant will be scored highly & FUNDED?

The SCIENCE & HOW WELL IT IS COMMUNICATED

*i.e., The 'review process' REALLY DOES work: (on AVERAGE)

- (in general, good science is funded, poor science is not. However when funding is extremely tight, the curve is very steep and small, almost arbitrary differences in scoring can easily push a good application out of the funding range.

*Learn the RULES and play by them

*FOLLOW the INSTRUCTIONS

Environmental and Molecular Toxicology

A proposal is an argument

- It is a work of persuasion and not a collection of disparate facts.
- It is not merely a description of the work you want to do; you are making an argument that it needs to be done and that you are the right person to do it.
- Make a tight, focused, compelling argument.

Reviewers Focus on the Four Cs

Clarity. Cross-reference current literature in laying out your premises.

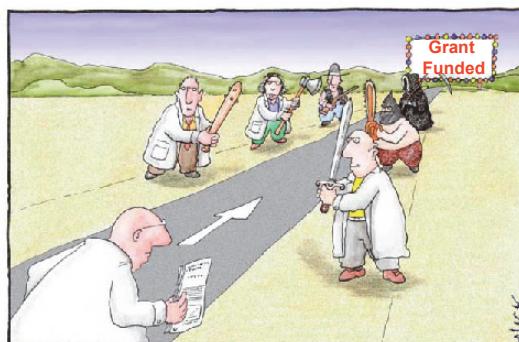

Content. Organize your ideas around associated aims linked to your central hypothesis. (The mission statement of each I/C sets forth its areas of emphasis.)

Coherence of concepts. Present a coherent set of ideas predicated on previous work.

Cutting edge. Be ready to take legitimate risks, preferably based on preliminary data, to move the science forward. NIH rates grant applications on innovation (see “Criteria for Rating of NIH Grant Applications” on this page).

17

Electronic Grants Submission and new Formats and Review Criteria

Most scientists regarded the new streamlined peer-review process as ‘quite an improvement.’

Grants Basics

Applying Electronically

Most competing grant programs at NIH require electronic application submission. Applicant organizations submit using Grants.gov, the federal-wide portal for finding and applying for grants. Applicants must track their application submission from Grants.gov to the eRA Commons, NIH's system for grants administration, to complete the submission process.

Electronic Application Process

```

graph LR
    A[1 Prepare to Apply & Register] --> B[2 Find Opportunity]
    B --> C[3 Prepare Application]
    C --> D[4 Submit, Track & View]
    
```

Process Overview

Submitting a multi-project application?

Make Sure To...

- **Register early!** Registration at both Grants.gov and eRA Commons is required, can take 6 weeks or more and MUST be completed before the submission deadline. [Learn more](#).
- Verify that your organization is registered with the new **System for Award Management (SAM)**. You must maintain an active entity registration (formerly Central Contractor Registration [CCR] to be renewed at least annually.) Use the SAM.gov "Manage Entity" function to manage your entity registrations. See the Grants Registration User Guide at [www.sam.gov](#) for additional information.
- **Carefully follow the requirements** found in the application guide and funding opportunity announcement. Instructions in the FOA supersede those found in the application guide.

Page 1 of 1

Fundamental Criteria Evaluated by Reviewers (for essentially all funding agencies)

1. Scientific and intellectual quality, and merit
2. Potential impact on field
3. Innovation: Is application novel, or does it have potential impact due to other merits.
4. Is there a clearly stated and valid hypothesis that can be rigorously tested by logical specific aims?

Fundamental Criteria Evaluated by Reviewers²⁴

5. Is there preliminary data to support the hypothesis?
6. Are the methods and procedures appropriate, adequate and feasible as proposed? Are the investigators qualified and/or experienced?
7. Are the facilities and environment adequate and appropriate?

25

Developing a Research Plan

1. Application **MUST** be based upon a strong hypothesis !!!!!!!!!!!!!!!
2. Application must be highly focused; and specific aims clearly related to and capable of testing the central hypothesis.
3. Almost all applications should address a **MECHANISM**. “**MECHANISTIC**”, not ‘**descriptive**’ , science always ranks best.
4. Application must reasonable and feasible. ‘Overly ambitious’ proposals fare poorly. Retain focus!
5. Specific Aims must be related and **MUST** rigorously test central hypothesis. Retain focus!

Environmental and Molecular Toxicology

Suggestions for good scientific writing

26

- ❖ Employ short, simple sentences and paragraphs. Goal is communication, not Nobel Prize in literature.
- ❖ Employ active rather than passive voice (“We will develop a cell line....”, not “a cell line will be developed...”)
- ❖ Keep related concepts together, and place clauses and phrases as close as feasible to the words modified.

Environmental and Molecular Toxicology

Suggestions for good scientific writing

27

- ❖ Edit mercilessly, especially for redundancy.
- ❖ Proof read extensively and repeatedly – including figure legends, tables and graphs. Look carefully for typographical and grammatical mistakes, omitted information, and errors in figures and tables. Eliminate any discrepancies!
- ❖ Neatness counts!!! Sloppy work always is reviewed poorly as it reflects unfavorably upon the investigators organization and competence.

Grantsmanship Essentials

28

- * Excellent Science
- * READ and Follow Directions (agency specific)
- * Be Succinct
- * Have others read (and re-read) your proposals
- * Don't rush
- * Make it easy for the reviewer
- * Make it easy for the reviewer
- * Make it easy for the reviewer

Make it easy for the reviewer²⁹

- * DO NOT ANTAGONIZE THE REVIEWER
- * THE REVIEWER SHOULD BE YOUR FRIEND
- * YOUR REVIEWER MUST BE YOUR ADVOCATE
- * HELP THE REVIEWER WHENEVER POSSIBLE
- * IF YOU GET A POOR SCORE:
 - The reviewers were not idiots (probably):
 - The science was bad
 - You wrote a poor grant
 - BOTH

Environmental and Molecular Toxicology

30

Make it easy for the reviewer

- * Reviewers are usually NOT experts in the precise topic of the proposal.
- * The proposal **MUST** be written so a person who is **NOT** an expert can understand it.
- * Avoid jargon, define abbreviations.
- * Provide adequate background information.

Environmental and Molecular Toxicology

Important to communicate clearly – all reviewers unlikely to be an expert in the field.

RENE DESCARTES EXPLAINS THE COORDINATE SYSTEM WHICH TIES TOGETHER ALGEBRA AND GEOMETRY

31

Make it easy for the reviewer

32

- * Reviewers have limited time – BE CONCISE.
(page limits are LIMITS, not suggested guidelines if the author is so inclined....)

- * ‘It is incumbent upon the APPLICANT to tell a coherent story to the Reviewer, NOT for the REVIEWER to ferret out what the applicant intends to do’. (“anonymous SRA, 1996”)

Make it easy for the reviewer

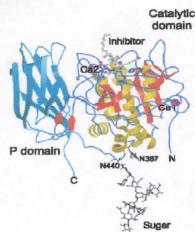

- * Grants are often reviewed late at night, on airplanes, in hotel rooms, etc.
- * The Applicant needs to invest the time to make the science readable and understandable.
- * Reviewers work as a service to the community, not for ego, money or prestige.

Make it easy for the reviewer

- * Reviewers are generally more senior scientists (i.e. older) and do not have 20/20 eyesight.
- * Make the grant easy to read: Reviewing is tiring.
- * FONTS – size and typeface (^{don't cheat}).
- * LINE SPACING (^{don't cheat}).
- * Provide WHITE SPACE.
- * Utilize PARAGRAPHS.
- * FIGURES and LEGENDS – suitable sizes.
- * Mark REVISIONS appropriately.

Principal investigator: [REDACTED]

Figure 2. Crystal structure of mouse furin (from Henrich et al, 2003)

The furin crystal structure (Figure 2) reveals many interesting aspects, not the least of which is an extremely acidic substrate-binding groove. This extended region of negative charge is sufficient to explain the highly inhibitory properties of polyangamines previously discovered in our combinatorial peptide library screening efforts. Another interesting finding was the novel structure of the P domain, a beta barrel which abuts the catalytic domain and affects catalytic parameters, and was found to be formed by a jelly-roll-type beta barrel (shown in blue in Figure 2 above). The furin structure was published this year in *Nature Structural Biology* (Henrich et al 2003, #7).

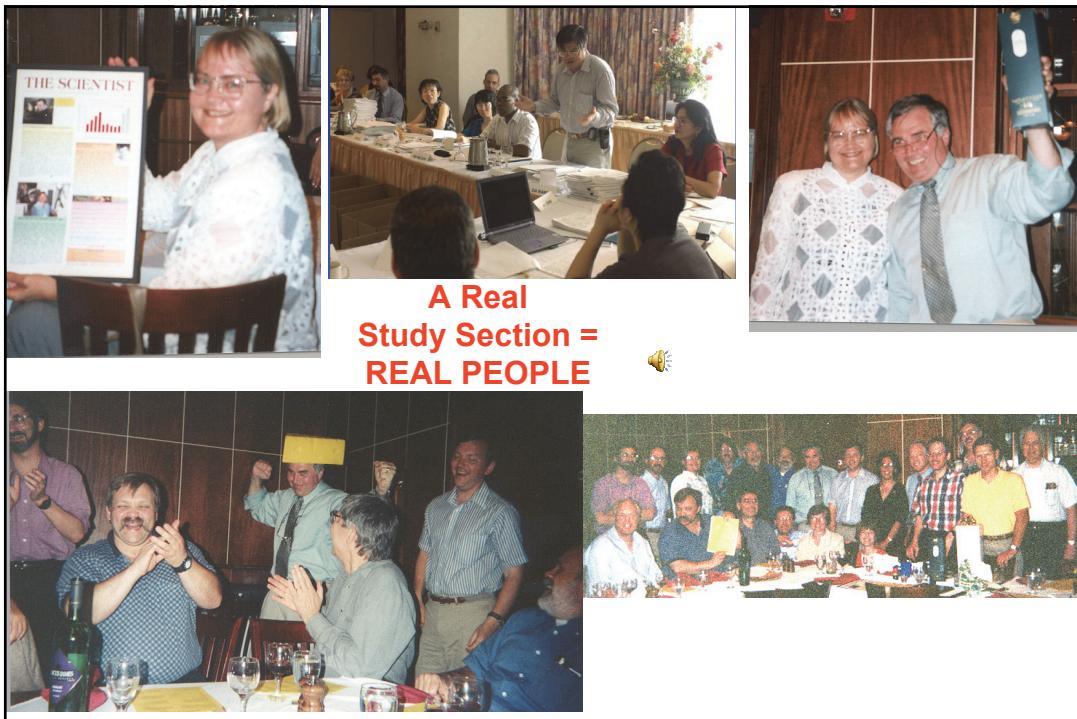

2. CRES collaboration (with G. Cornwall). The protein CRES is a testes-specific cystatin-related protein which is however inactive against cysteine proteinases due to its lack of certain critical residues (Cornwall et al 2002, #6). We have collaborated with Dr. Gail Cornwall of Texas Tech to examine the inhibition of this protein against PC2; Dr. Cornwall initially contacted us because PC2 is colocalized with CRES in testicular tissue. Our experiments surprisingly showed that CRES represents a potent inhibitor of PC2, with inhibitory activity in the nanomolar range. Other serine proteases and other proprotein convertases were not affected. We are continuing to collaborate with Dr. Cornwall on structure-function analysis of CRES inhibition (Cornwall et al, 2000; #6).

3. Development of the mini-RIA. In order to facilitate radioimmunoassay of a large number of fractions derived from size fractionation of precursor cleavage products, we developed a "mini-RIA" procedure in which tubes are handled in 96 well racks during the majority of the RIA. This technique, which saves considerable operator time, has now been published in *Analytical Biochemistry* (Laurent and Lindberg, 2002; #5). This technique will be useful in analyzing the effect of mutations on specificity in Aim 1.

4. Overexpression of CPE, PAM and POMC. We have recently initiated the overexpression of rat CPE (vector obtained from Dr. Lloyd Fricker of AECOM) using the CHO cell system, and have received PAM-3-overexpressing CHO cells from Dr. Betty Eipper of the University of Connecticut, which we are in the process of amplifying further. Expression has been confirmed using enzyme activity assay as well as Western blotting. The current estimated expression levels of CPE and PAM-3 are about 0.1 mg/liter (based on the known specific activity of purified recombinant CPE and PAM-3 previously obtained from the Fricker and Eipper laboratories; we have also obtained recombinant PAM-3 from Unigene); however, we have only begun methotrexate amplification, and expect to ultimately achieve 10-20 times these levels. These studies support our ability to perform the experiments described in Specific Aim 4.

PROJECT GENERATED RESOURCES: During the course of this work we have generated milligram quantities of convertases (mouse PC1, mouse PC2, and human and mouse furins) and developed inhibitors useful both *in vivo* and *in vitro*. We make limited quantities of both purified proteins and peptides (where financially feasible) available to the scientific community. In addition, we have generated recombinant prodynorphin, proenkephalin, proenkephalin antisera, and proenkephalin

Include ample white space between small paragraphs with simple figures and diagrams.

**A Real
Study Section =
REAL PEOPLE**

APPLICATION PLANNING Guidelines

37

- ❖ Critically evaluate the field and its literature.
- ❖ Critically evaluate YOUR familiarity and experience with the field and its literature.
- ❖ Are the key research questions in the field well defined and is there consensus?
- ❖ Is it a 'mature' field of study or is it over studied?
- ❖ Is the work proposed novel or simply modest extensions of previous work?
- ❖ Is the work controversial?
- ❖ Discuss proposed scope of work with appropriate agency program staff –they are supposed to help you.

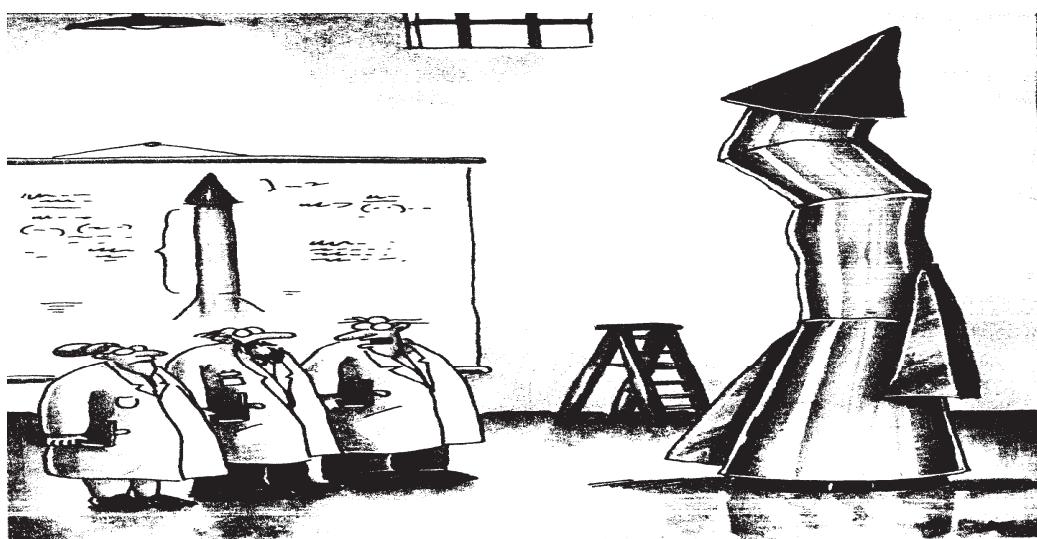

Environmental and Molecular Toxicology

Evaluation of Research Plan

38

"It's time we face reality, my friends...We're not exactly rocket scientists."

Environmental and Molecular Toxicology

RESEARCH PLAN Guidelines

39

- ❖ Make certain you have CURRENT application materials, instructions and deadlines!
- ❖ Make certain all aspects of experimental design are hypothesis driven. Limit descriptive studies to those essential to support mechanistic studies, and provide rationale and justification for ALL experiments.
- ❖ Ensure all specific aims are related and focused toward central hypothesis.
- ❖ Critically evaluate and then provide support for feasibility of specific aims.
- ❖ Justify scope of application.

Environmental and Molecular Toxicology

RESEARCH PLAN Guidelines

40

- ❖ Present information, clearly, logically and straightforward as possible.
- ❖ Reinforce innovative aspects of project.
- ❖ Clearly describe what new information will be forthcoming and what gaps in a field will be addressed.
- ❖ Cite literature appropriately (qualitatively and quantitatively – but don't write a review).
- ❖ Reiterate the central hypothesis and its rationale.

Environmental and Molecular Toxicology

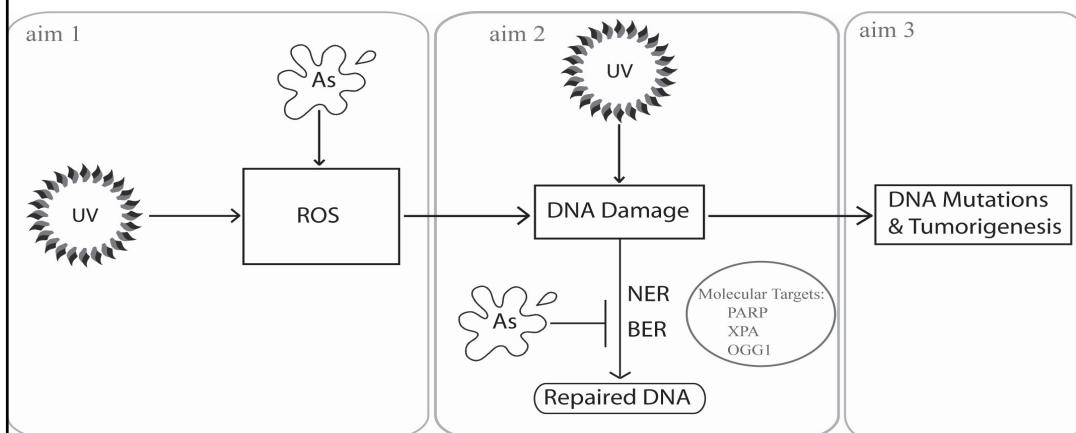

It can be extremely helpful to include diagrams, flow charts or cartoons to help illustrate key concepts in your proposal.

PARTICLE ACCELERATOR
TO CIRCLE AUSTRALIA

But Don't over do it. SIMPLICITY and CLARITY are the goal. It does no good to further confuse the reviewer.

The central hypothesis for the current proposal is that arsenic acts as co-carcinogen for UVR-induced skin tumorigenesis through a dual mechanism involving elevated oxidative stress and inhibition of DNA repair that results in increased DNA damage and tumor formation. (Fig 1).

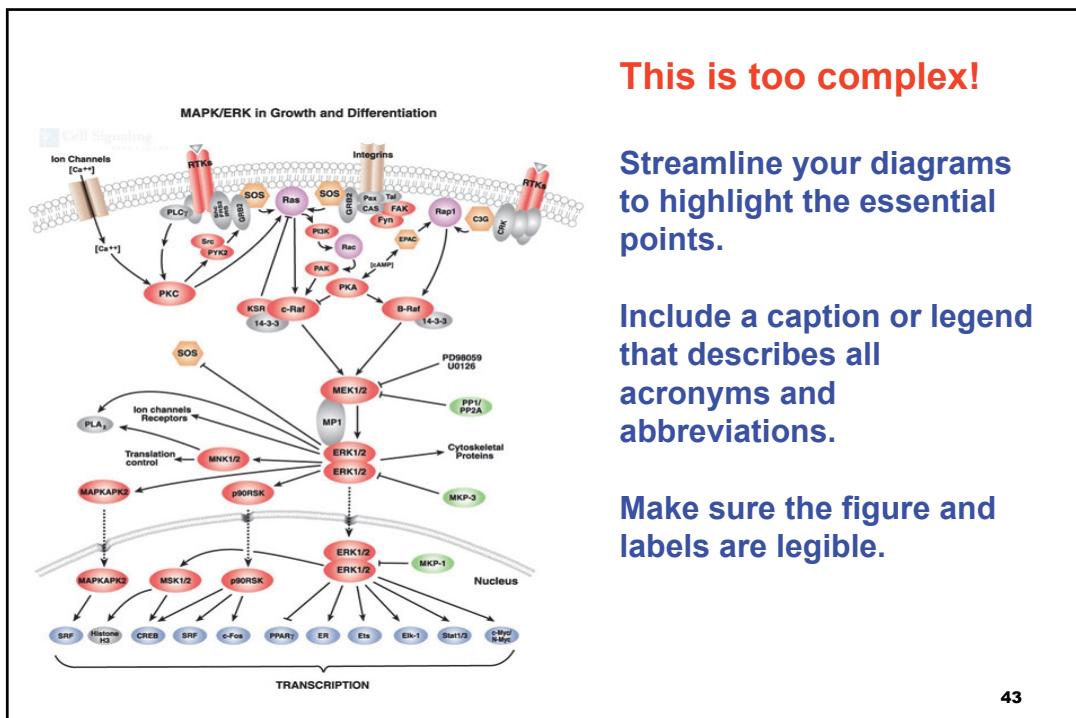

This is too complex!

Streamline your diagrams
to highlight the essential
points.

Include a caption or legend
that describes all
acronyms and
abbreviations.

Make sure the figure and
labels are legible.

ORGANIZING THE GRANT

44

- * ABSTRACT
 - * SPECIFIC AIMs
 - * Background and Significance
 - * Preliminary Results
 - * Experimental Approach
 - * Materials and Methods
 - * Human Subjects
 - * Vertebrate Animals
 - * Literature Cited
- HYPOTHESIS
- Short – but often requires
the most time and effort

HYPOTHESIS Guidelines

45

- ❖ Ensure that the application contains a clearly stated and testable hypothesis and one that is relevant to the mission goals of the funding agency.
- ❖ Ensure that testing the central hypothesis will provide important new information and advance the field.
- ❖ Ensure that the hypothesis is directly testable by the proposed methodology and specific aims.
- ❖ Make certain the central hypothesis is clearly stated in both the Abstract and Specific Aims.

Environmental and Molecular Toxicology

ABSTRACT Guidelines

46

- ❖ Strictly adhere to word limitations or space limitations (do not circumvent with small fonts.)
- ❖ Clearly state the central hypothesis.
- ❖ Clearly state and very briefly describe objectives (often done by stating specific aims).
- ❖ Clearly delineate the significance of the proposed research.
- ❖ Clearly indicate how and why the proposed work is innovative.
- ❖ Briefly outline the experimental approach.

Environmental and Molecular Toxicology

Developing Specific Aims

47

1. Specific Aims are EXTREMELY important. Present initial and lasting impression of the application. (like a first date - usually generates an ‘initial score’ for the reviewer that is difficult to overcome with the remainder of the application!)
2. Aims should clearly state objectives and goals which are highly focused and rigorously test the hypothesis.
3. If you have more than one hypothesis (not recommended) formulate and state aims for each.
4. Ensure that methods and approach relate directly to hypothesis and aims.
5. Present alternative hypotheses and justify selection of the one you propose to test.
6. DO NOT confuse Aims with “Long-term Goals”.

48

"My project is simply this. I want to find out once and for all whether there's any truth in the belief that money can't buy happiness."

BACKGROUND & SIGNIFICANCE Guidelines (Changed for new NIH format)

- * Keep the statement of significance brief AND succinct, BUT clearly state it for the reviewers.
- * Clearly state and demonstrate how your research is innovative, or develops or improves technology.
- * Delineate how the hypothesis and research will increase current state of knowledge in field.

Significance of Proposed Work

BACKGROUND & SIGNIFICANCE

Guidelines (Changed for new NIH format)

51

- * Relate goals of application to the longer-term, big picture scientific objectives and to the betterment of public health.
- * Justify your proposal with background information about the research field and demonstrate to reviewers that you understand the field and have a balanced and adequate knowledge of it.
- * Use this section to discuss gaps or discrepancies in the field and identify the next logical stage of research beyond your current application.

Environmental and Molecular Toxicology

Preliminary Data

52

You've turned lead into gold? Good.
Do it again, write a detailed description
of how you did it, and submit it to
peer review.

Environmental and Molecular Toxicology

PRELIMINARY DATA Guidelines

53

(Changed for new NIH format)

- * Providing preliminary data is extremely important and should convince reviewers that you are qualified in the technologies and methods proposed and can critically interpret results from such studies (**publications**).
- * Preliminary data must support the hypothesis to be tested and demonstrate feasibility of the project.
- * Preliminary data may consist of your own publications, publications of others, manuscripts submitted for publication from your laboratory, unpublished data from your own laboratory or from others, or some combination of these.
- * Make sure it's clear which data are yours and which were reported by others.

Environmental and Molecular Toxicology

Experimental Design and Methods Guidelines

54

- * Describe the experimental design and procedures in detail and give a rationale for their use.
- * Organize this section so each experiment or set of experiments corresponds to one of your specific aims and is titled and numbered in the same order.
- * Experiments MUST follow a logical sequence.

Environmental and Molecular Toxicology

Experimental Design and Methods Guidelines

55

- * **Convince** reviewers that the methods you chose are appropriate and that, unless innovative, they are well established.
- * If your methods are innovative, show how you have changed existing, proven methods while avoiding technical problems.
- * Define why the new methods are advantageous to the research you propose to do.

Environmental and Molecular Toxicology

Experimental Design and Methods Guidelines

56

- * Define why the new methods are advantageous to the research you propose to do.
- * Most applications now permit colored charts, graphs, and photographs in their applications.
- * Describe any hazardous procedures, situations, or materials and appropriate precautions.
- * Include supporting publications from your lab as appendix.

Environmental and Molecular Toxicology

Experimental Design and Methods Guidelines

- ❖ Ensure that selected methods are appropriate to achieve the stated specific aims.
- ❖ Justify each experiment proposed and provide rational for its relevance to the central hypothesis.
- ❖ Present rationale and justification for appropriateness of methodology for each experiment, especially if it is novel.

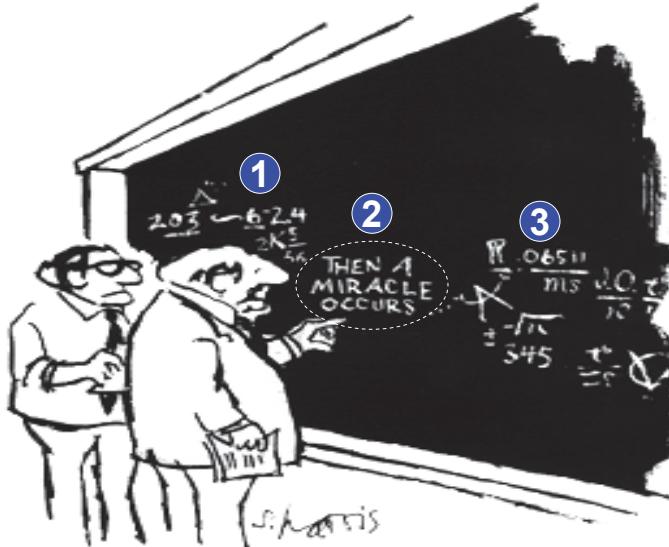

Experimental Design Guidelines

- * While you may assume reviewers are experts in the field and familiar with current methodology, NOT ALL WILL BE, and they will not make the same assumption about you. It is not sufficient to state, “We will grow a variety of viruses in cells using standard in vitro tissue culture techniques.” Reviewers want to know which viruses, which cells, and specific techniques; and most of all: the rationale for using the particular system.
- * **HOWEVER, do not provide excessive experimental detail at the expense of EXPERIMENTAL DESIGN. (Don't confuse the two!!!)**

Experimental Design

"I think you should be more explicit here in step two."

Experimental Design and Methods Guidelines

- * Call attention to potential difficulties you may encounter with each approach. Reviewers will be aware of possible problems; propose alternatives and convince them you can handle such circumstances.
- * Discuss how any experimental limitations will affect results and interpretation of data.
- * Include discussion of appropriate CONTROLS (can't have too many), expected results and how data will be interpreted (not just analyzed, or statistics).

Data Analysis and interpretation

This section must not be superficial!

"It's black, and it looks like a hole.
I'd say it's a black hole."

Environmental and Molecular Toxicology

Experimental Design and Data Analysis 62

- * Demonstrate awareness of the limits of the results you can expect. State the conditions under which the data would support or contradict the hypothesis and the limits you will observe in interpreting the results.
- * Convince reviewers you will be able to interpret your results by revealing your understanding of the complexities of the subject.
- * Many applications benefit from statistical analysis. The early involvement of a statistician to determine the amount of data to collect and the methods for analyses is often essential. **Must have a Power analysis to validate sample size.**
- * Describe your proposed statistical methods for analyzing the data you plan to collect.
- * Define the criteria for evaluating the success or failure of each Specific Aim.

Environmental and Molecular Toxicology

Experimental Design and Methods Guidelines

- ❖ Discuss anticipated data, their significance and the limits of the anticipated data.
- ❖ Discuss how the data will be interpreted (not just analyzed)
- ❖ Recruit statisticians as consultants if appropriate
- ❖ Clearly define criteria for evaluating the success or failure of each specific aim, as well as the central hypothesis.

Data Analysis

Guidelines for LITERATURE CITED 65

- * Refer to the literature thoroughly and thoughtfully but not to excess. The publications you cite need not be exhaustive but should include those most relevant to your proposed research.
- * Do not omit or overlook or omit references to relevant published research indicating that the proposed approach has already been attempted or the methods proposed may be inappropriate for answering the questions posed.
- * Follow required format!!! Varies, but each citation usually requires the names of all authors (not et al.), name of the book or journal, volume number, page numbers (not first page only), and year of publication.

Environmental and Molecular Toxicology

66

Format Guidelines:

**READ and Follow the
Directions!!**

Do not cheat or fudge.

Environmental and Molecular Toxicology

Format Guidelines

67

- ❖ Type setting (font size and spacing) requirements are stated and must be adhered too – (may be fixed for some online applications).
- ❖ Most formats require minimum of 11 point font, minimum of 15 cpi and minimum 6 lines per inch.
- ❖ Best to use larger fonts to improve readability
- ❖ Include sufficient white space and figures.
- ❖ Font in figures and tables may often be somewhat smaller, but ensure it is easily legible.
- ❖ Do not twiddle with fonts to circumvent page limitations!

Environmental and Molecular Toxicology

Budget

68

The budget is important for two reasons:

- 1) It must provide sufficient resources to do the work proposed. It is counterproductive to underbudget a grant, you are setting yourself up for failure to achieve the stated aims.
- 2) The budget must be realistic and correspond to the scope of the work proposed. If you over or under budget, a reviewer will infer you are inexperienced and incapable of conducting the work successfully.

Environmental and Molecular Toxicology

Budget & Justification

Generally need to provide at least a brief 'Justification' for each major budget category, even for modular grants.

Be REALISTIC in your requests!
Do your homework on costs!

Often, NO SPECIFIC FORMAT, BUT ADDRESS and clearly justify EACH MAJOR BUDGET CATEGORY – ESPECIALLY PERSONNEL, TRAVEL, EQUIPMENT AND SUPPLIES. Very helpful to link budget items, including personnel to each specific aim that they are essential for.

You will be living with the budget for the duration of the grant, so try to develop a good 'relationship' with it at the beginning.

www.FieldstoneAlliance.org

70

“The Grant”: Key Aspects of the Research Plan

- 1) What do you intend TO DO?**
- 2) Why is the work important?**
- 3) What has already been done?**
- 4) How are you going to do the work?**

Environmental and Molecular Toxicology

THE REVIEW CRITERIA: Generally similar criteria ⁷² for all applications (NIH ‘gold standard’). Write application targeted to address review criteria – may vary between funding agencies.

*** OVERALL IMPACT**

- SIGNIFICANCE**
- APPROACH**
- INNOVATION**
- INVESTIGATOR**
- ENVIRONMENT**

Environmental and Molecular Toxicology

Additional Information:

*Timeline (detailed): will vastly strengthen an application and is often omitted.

* Compliance:

- (Bio)hazards
- Vertebrate Animals
- Human Subjects (women, children, minorities)
- Recombinant DNA
- Blood born Pathogens

Use of Animals, Humans and hazardous materials in research must be addressed

"The beauty of math, of course, is that we don't even need an ethicist."

RESEARCH PLAN Guidelines

75

- ❖ Make certain the proposed budget is appropriate for the proposed studies and consistent with agency guidelines.
- ❖ Include ALL required information for human subjects, vertebrate animals and biohazards.
- ❖ Include detailed timetable for proposed studies and ensure it is consistent with experimental design.

Environmental and Molecular Toxicology

WRITING THE GRANT

76

-
- The diagram illustrates the structure of a grant application. At the top right is a large gray box containing the word "HYPOTHESIS". To its left, two arrows point towards a vertical list of grant writing sections. The sections are listed as follows:
- * ABSTRACT
 - * SPECIFIC AIMS
 - * Background and Significance
 - * Preliminary Results
 - * Experimental Approach
 - * Materials and Methods
 - * Human Subjects
 - * Vertebrate Animals
 - * Literature Cited

Environmental and Molecular Toxicology

Grantsmanship Essential:

FOCUS

Environmental and Molecular Toxicology

Identify & Maintain a Research Interest 78

"Bunsen, I must tell you how excellent your study of chemical spectroscopy is, as is your pioneer work in photochemistry - but what really impresses me is that cute little burner you've designed"

Environmental and Molecular Toxicology

COMMON “FATAL FLAWS” OF (NEW) INVESTIGATORS:

79

- *OVERLY AMBITIOUS.
- *POORLY FOCUSED.
- *LACK OF: EXPERIMENTAL DESIGN and RATIONALE (NOT LACK OF ‘METHODS’).
- *LACK OF: ALTERNATIVE APPROACHES.
- *LACK OF: ANTICIPATED DIFFICULTIES.
- *LACK OF: APPROPRIATE CONTROLS (POSITIVE AND NEGATIVE).
- *LACK OF: ANTICIPATED RESULTS, DATA INTERPRETATION AND DATA ANALYSIS, STATISTICS.

Environmental and Molecular Toxicology

NEW INVESTIGATORS

80

- * ALWAYS have others read your proposal.
- * Have MANY others read your proposal.
- * LISTEN to their criticisms – don’t be defensive.
- * Get assistance – have a MENTOR and Get HELP. Read Examples of Successful Applications.
- * DON’T put all your eggs in one basket – be flexible, maintain breadth but *not at the expense of focus*.
- * PRACTICE – write multiple grants to multiple agencies.
- * DO YOUR HOMEWORK – target your proposal.

Environmental and Molecular Toxicology

**Target the proposal
to appropriate
agency and in the
case of NIH, the
appropriate Institute
and specific IRB.**

"This is the part I always hate!"

Environmental and Molecular Toxicology

Prevent these major reasons for causing poor review scores:

- *Lack of original ideas*
- *Lack of acceptable scientific rationale*
- *Lack of knowledge of relevant published work*
- *Lack of experience in essential methodology*

83

COMMON FATAL ERRORS:

84

- *DON'T 'CUT and PASTE'
- *Nearly impossible to catch all inconsistencies, and can often lead to comment: "*This proposal leaves the impression that it has not been carefully planned and prepared*".
- *Have OTHERS PROOF READ your application!
- *DON'T rush or wait till deadline – leave time for reflection, internal review, and revision.
- *PROOF READ! PROOF READ! PROOF READ!

COMMON FATAL ERRORS:

- ❖ Lack of significance of the hypothesis or the problem being studied.
- ❖ Scientific validity questionable or invalid.
- ❖ Equivocal hypothesis and/or preliminary data
- ❖ Lack of originality or lack of innovation.
- ❖ Experimental design is superficial or unfocused.
- ❖ Overly ambitious experimental plan – scope of work unfocused or unrealistic for budget or timeline proposed.

COMMON FATAL ERRORS:

- ❖ Lack of testable hypothesis, descriptive vs. mechanistic experimental design. (“Fishing expedition, snipe hunt or molecular groping, methodology in search of a question”).
- ❖ Proposed experiments lack appropriate or sufficient controls (need BOTH positive and negative controls).
- ❖ Innovative proposal but lacking sufficient preliminary data to support proposed work (i.e ‘risky’).
- ❖ Preliminary data presented do not in fact support the hypothesis to be tested, or fully demonstrate the feasibility of the proposed work (“data of convenience”).

COMMON FATAL ERRORS:

87

- ❖ Rationale not provided for experiments, methods, model systems, relevance to hypothesis.
- ❖ Lack of alternative approaches and techniques if primary approach fails.
- ❖ Insufficient methodological detail to convince reviewers the investigator is competent.
- ❖ Lack of discussion of potential problems, difficulties and limitations of methods.
- ❖ Selection of inappropriate model systems (i.e studying the expression of a pulmonary protein using a liver cell line, simply because that line is available).

COMMON FATAL ERRORS:

88

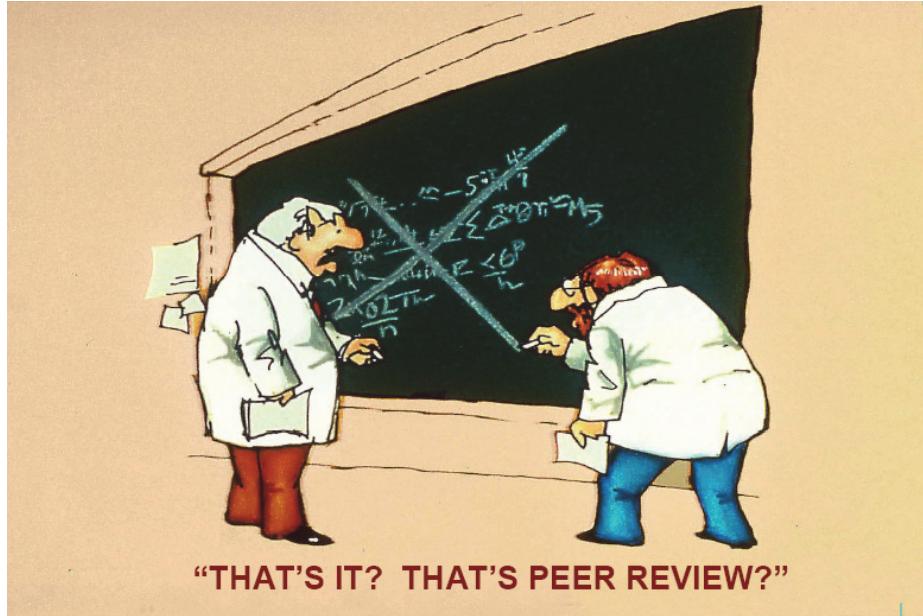

- ❖ Investigator lacks demonstrable experience (publications, preliminary data) in proposed techniques or has not recruited a member of research team or collaborator who does.
- ❖ Application lacks critical and appropriate literature citations leaving impression applicant is unfamiliar with field or neglecting key or contradictory data.
- ❖ Application is unclear as to which data discussed was obtained by applicant or has been reported by others.

Final Hints:

- * If at first you don't succeed, try, try again.
- * Get Assistance!
- * Constantly re-evaluate your proposal.
- * Know when to cut your losses.
- * Accept the challenge and commitment to research as required in today's VERY highly competitive funding environment.
- * STAY FOCUSED !!!!!

Guidelines for Revising Applications

91

- *READ the summary statement and identify the problems.
- *Address reviewers' comments point by point and identifying changes clearly.
- *Provide a summary of substantial additions, deletions and changes (usually 1-3 page "Introduction").
- *Clearly delineate sections that are the same in the previous application and those that are different, showing precisely where changes were made and new information added.
- *If you disagreed with the reviewers, explain WHY indicated where new information was added (font, marginal notations – follow directions!).

Environmental and Molecular Toxicology

RESPONDING TO THE REVIEW

92

- *DON'T get angry
- *READ the review and THINK about it.
- *Have OTHERS read the review – new investigators may need an 'interpretation'.
- *RESPOND to the criticisms
- *Re-evaluate the ENTIRE proposal
- *CLEARLY delineate the CHANGES in the revision (MIEFTR).

Environmental and Molecular Toxicology

THE REVIEW

93

“I don’t mind if the applicant tells me I am wrong or disagrees with me.....,

but I don’t like to be ignored”

(anonymous reviewer, 1998)

Environmental and Molecular Toxicology

Interpreting THE REVIEW: Learning the Lingo

94

“This applicant lacks any discernable aptitude for the biological sciences.....”

(anonymous reviewer, 1998)

Environmental and Molecular Toxicology

**Persistence is
KEY – Grants are
rarely funded
during first
submission.**
